## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Sintered Mullite competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Sintered Mullite is a high-temperature refractory material produced by calcining alumina-rich raw materials to form mullite phases with excellent thermal shock resistance, high refractoriness and mechanical stability. In 2024, global production of sintered mullite is estimated at approximately 2.15 million tons, with an average international market price of US\$380 per ton. Gross margins generally range from 15%?28%, depending on alumina grade, calcination temperature, energy cost and impurity control. The upstream supply chain includes high-alumina bauxite, andalusite and industrial alumina; midstream producers perform crushing, shaping and high-temperature sintering; downstream applications include refractory bricks, castables, kiln furniture, steel ladle linings, cement kilns and petrochemical furnaces. The sintered mullite market is expected to maintain steady growth due to ongoing refractory upgrades in steel, cement and petrochemical industries. As global energy efficiency standards tighten, demand is shifting toward higher-purity mullite with lower impurities and improved thermal shock resistance. China remains the main production base, but supply diversification and price stabilization will gradually reshape trade flows through 2031.

The global Sintered Mullite market size was estimated at USD 818.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.30% during the forecast period.
