Abstracts

Sintering silicon carbide (SiC) is produced by initially mixing fine (sub-micron) and pure silicon carbide powder with non-oxide sintering aids. The powdered material is formed or compacted by using most of the conventional ceramic forming processes such as die pressing, isostatic pressing and injection moulding. Following the forming stage the material is sintered in an inert atmosphere at temperatures above 2000°C. The sintered silicon carbide can then be machined to precise tolerances using a range of precision diamond grinding or lapping techniques. As with most advanced ceramics the cost of the component is reduced if the amount of diamond grinding is reduced i.e. either the material manufacturer can achieve the required tolerances as sintered or the designer removes unnecessary tolerances. Sintered Silicon Carbide is a high-performance ceramic material made from silicon carbide (SiC) powder through a high-temperature sintering process. Sintering is the bonding of powder particles to each other at high temperatures to form a strong, solid material.

The global Sintering Silicon Carbide market size was estimated at USD 2751.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.00% during the forecast period.
