## Abstracts

The testing of silicon photonics mainly includes the testing of its optical and electrical performance. The testing is mainly divided into two stages: wafer-level testing and module-level performance testing after packaging. Wafer-level testing refers to the testing and screening of each unit or sub-unit on the wafer with the help of a probe station after the wafer production is completed; module-level performance testing after packaging, when the device is packaged into a module, it is necessary to verify the performance of the module's transmitter and receiver at different ambient temperatures and compliance with relevant specifications. These tests are performed when sending or receiving optical/electrical signals at normal rates, and must strictly refer to relevant specifications.

The global SiPh Wafer Test System market size was estimated at USD 97.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 28.20% during the forecast period.
