Report Overview

Epiluminescence Microscopy is the examination of skin lesions with a dermatoscope. This traditionally consists of a magnifier (typically x10), a non-polarised light source, a transparent plate and a liquid medium between the instrument and the skin, and allows inspection of skin lesions unobstructed by skin surface reflections. Modern dermatoscopes dispense with the use of liquid medium and instead use polarised light to cancel out skin surface reflections.

The global Skin Epiluminescence Microscopy market size was estimated at USD 315 million in 2023 and is projected to reach USD 880.56 million by 2032, exhibiting a CAGR of 12.10% during the forecast period.
