Abstracts

Skin freezing technology, also known as cryotherapy or cryosurgery in medical contexts, refers to the controlled application of extreme cold, typically using liquid nitrogen or argon gas, to destroy abnormal or diseased tissue such as skin lesions, warts, actinic keratosis, and certain types of skin cancers by inducing cell death through rapid freezing and subsequent thawing cycles. This minimally invasive procedure is valued for its precision, reduced recovery times, and lower risk of scarring compared to traditional surgical excision, and it is commonly performed in dermatology clinics, medical spas, and specialized aesthetic centers, with applications extending to both medical treatments and cosmetic enhancements like cryofacials for skin rejuvenation.

The global Skin Freezing Technology market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
