Report Overview

Skin moisture tester is an intelligent skin moisture testing tool that uses bioelectrical impedance analysis technology to measure and calculate the moisture status of the skin with high precision through a microcomputer. This instrument is based on the conductivity method and uses the conductivity of electrolytes in the stratum corneum. When the test probe contacts the skin, it will show a conductivity corresponding to the water content, and its correlation coefficient can reach 0.99. Therefore, the change in conductivity can very sensitively reflect the water content of the stratum corneum. The main functions of the skin moisture tester include measuring the moisture content of the skin, displaying the instantaneous moisture content of the skin, and possibly providing an average value of the skin moisture. This instrument is often used at beauty counters to explain the moisturizing effect of skin care products.
