Abstracts

Skin packaging is classified into two types: Carded and non-carded. Carded skin packaging consists of a piece of paperboard and a thin sheet of transparent plastic heat sealing, which is wrapped over the paperboard. The product is placed between them during the packaging process. Non-carded skin packaging consists of a thin sheet of plastic wrapped over the product. A vacuum is created between the product and skin packaging to avoid contamination of the product due to contact with air. During 2017, the carded skin packaging segment dominated the skin packaging market and accounted for a major part of the overall market share. The major reason responsible for the growth of this segment is the barrier properties of packaging films used by the carded skin packaging, that extends the shelf life of the packaged products and minimizes leakages.

The global Skin Packaging market size was estimated at USD 7911.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.60% during the forecast period.
