Abstracts

Skin repair dressings are medical materials used to promote skin healing, protect wounds and provide a moist environment. They are usually made of materials with good biocompatibility, such as alginate, hyaluronic acid or collagen. The dressings can help relieve wound pain, reduce the risk of infection, and accelerate the regeneration and repair process of skin tissue. Skin repair dressings are widely used in skin care for burns, ulcers, trauma and postoperatively, providing effective barrier protection and healing support for damaged skin. Skin repair dressings play an important role in wound care and skin healing. By providing a moist and protective environment for the wound surface, they effectively accelerate the repair of skin tissue and reduce the risk of infection and pain. Compared with traditional gauze, modern skin repair dressings have better biocompatibility, can promote cell regeneration and reduce scars. However, their high cost and allergic reactions to certain specific materials are still factors that need to be considered. Overall, with technological advances, skin repair dressings provide a more efficient and comfortable option for wound treatment, and have broad application prospects in the medical and beauty fields in the future.

The global Skin Repair Dressing market size was estimated at USD 4042.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 35.40% during the forecast period.
