Report Overview

The skinfold thickness meter is a medical device used to measure the skinfold thickness of the human body. The main test parts are the triceps brachii and the lower angle of the scapula. About 2/3 of the body's fat is stored in subcutaneous tissue. By measuring the thickness of subcutaneous fat, we can not only understand the thickness of subcutaneous fat and judge a person's obesity, but also estimate the amount of fat in the whole body to evaluate the proportion of human body composition. This is the easiest way to assess body composition. Subcutaneous fat thickness can be used to initially evaluate the nutritional status of the person being measured, thereby providing a basis for nutritional support. Skinfold thickness is an indicator of body fat content. This method is simple and easy to perform, but requires specially trained personnel to measure it.
