Abstracts

Slag-based green cement is a type of hydraulic cement in which a significant portion of the traditional clinker (typically 30-95%) is replaced by ground granulated blast-furnace slag (GGBS), a byproduct of the iron and steel industry. This substitution reduces the carbon footprint associated with cement production, as slag activation requires less energy and emits fewer greenhouse gases compared to clinker manufacturing. The resulting cement exhibits enhanced durability, sulfate resistance, and lower heat of hydration, making it particularly suitable for large-scale infrastructure projects, marine environments, and sustainable construction applications. By utilizing industrial waste, slag-based cement aligns with circular economy principles and contributes to lowering the overall environmental impact of the construction sector.

The global Slag Based Green Cement market size was estimated at USD 2530.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.65% during the forecast period.
