Report Overview

A sliding centrifuge is a type of centrifuge that operates by sliding the rotor along a horizontal axis. This design allows for easy loading and unloading of samples, as well as efficient separation of different components based on their density.

In a sliding centrifuge, the rotor is typically mounted on a sliding carriage that can move back and forth along a track. This allows the samples to be loaded and unloaded without the need to stop the centrifuge or remove the rotor. The sliding motion also helps to distribute the samples evenly along the rotor, ensuring balanced separation.

The centrifugal force generated by the spinning rotor causes the denser components of the sample to move towards the outer edge, while the less dense components remain closer to the center. This separation is used in various applications, such as in medical laboratories for separating blood components or in industrial processes for separating different types of particles or liquids.
