Abstracts

Sliding watertight doors are specialized marine closure systems designed to prevent the ingress of water in the event of flooding, thereby maintaining compartmental integrity and enhancing vessel safety. These doors are engineered with robust materials such as steel or aluminum and feature sealing mechanisms—often rubber gaskets—activated by hydraulic, pneumatic, or manual systems to ensure a watertight seal when closed. They are distinct from conventional doors due to their ability to withstand substantial hydrostatic pressure and their compliance with stringent international maritime regulations, such as those set by the International Maritime Organization (IMO) and classification societies like DNV and ABS. Typically installed in ships, offshore platforms, submarines, and other marine structures, sliding watertight doors are critical safety components that contribute to operational security, damage control, and regulatory adherence in marine environments.

The global Sliding Watertight Doors market size was estimated at USD 120.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.75% during the forecast period.
