Abstracts

Slip ring torque transducers are specialized electromechanical devices designed to measure torque in rotating systems while simultaneously transmitting power and electrical signals across the rotating interface. Unlike non-contact torque sensors, they incorporate slip rings and brushes to maintain continuous electrical connectivity, enabling real-time data acquisition from strain gauges mounted on the shaft. These transducers are particularly valued in applications requiring high precision, robustness, and the ability to operate in demanding environments where wireless or inductive alternatives may be limited by factors such as electromagnetic interference, extreme temperatures, or the need for uninterrupted power supply. Their design allows for accurate torque measurement without constraints on the number of rotations, making them suitable for long-duration testing, heavy machinery, automotive drivetrains, and industrial equipment where rotational movement is continuous and multidirectional.

The global Slip Ring Torque Transducers market size was estimated at USD 180.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
