Abstracts

A slip ring is a rotating connector that can transmit power or electrical signals outside the rotating body. Power and signals are transmitted through a metal ring placed on the rotating body and a brush on the fixed side. It is used to measure the vibration, stress, and axial force of the rotating body and transmit minute signals for control purposes. They often serve as lead wires that supply power to the rotating body. Slip rings frequently work on indexed platforms in semiconductor processing equipment to physically and chemically process wafers where manufacturing may include the application of materials and fluids. For example, during the chemical-mechanical planarization process ? a procedure that often occurs late in semiconductor production and must move quickly ? the integrated slip ring rotary joints shine, particularly in terms of resisting corrosive and abrasive settings.
