Abstracts

Slope Stability Radar is a kind of monitoring equipment that uses radar technology to detect and analyze the stability of slopes. It works by emitting microwave signals and receiving the reflected signals from the slope surface. Through the analysis of the phase, amplitude and frequency of the reflected signals, information about the displacement, deformation and movement of the slope can be obtained, so as to evaluate the stability of the slope and provide early warning of potential landslides or other slope-related disasters. It has been developed to remotely scan a rock slope to continuously measure the movement of the face.

The global Slope Stability Radar market size was estimated at USD 265.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.80% during the forecast period.
