## Abstracts

The slope wireless monitoring and early warning system is an intelligent system used to monitor the stability of slopes (such as hillsides, mines, construction sites, etc.) in real time. It monitors slope deformation, tilt, cracks, soil moisture and other parameters in real time through a wireless sensor network. The system collects data through wireless sensors and transmits it to the central control platform for analysis and processing. When the slope changes abnormally or approaches a critical point of danger, the system will automatically send out an early warning signal to remind staff to take measures to avoid disasters.

The global Slope Wireless Monitoring and Early Warning System market size was estimated at USD 1206.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.50% during the forecast period.
