Abstracts

The slot drainage system is a drainage scheme that collects surface and groundwater through preset narrow slits or slots. It mainly consists of slot drainage ditches, cover plates, water collection wells and pipes. Its core feature is to intercept water flow with high-precision gaps (usually 5-20mm in width), combining efficient drainage with concealed aesthetics. It is suitable for places such as squares, roads, airports, and sports fields that have high requirements for ground flatness and landscape. The system is mostly made of resin concrete, stainless steel or polymer composite materials, which have the advantages of pressure resistance, corrosion resistance and self-cleaning.

The global Slot Drainage System market size was estimated at USD 1216.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
