Abstracts

A slotted optical switch is a type of optoelectronic device that consists of an infrared LED emitter and a phototransistor receiver positioned opposite each other within a U-shaped housing, creating a precise gap or "slot" through which an object can pass to interrupt the light beam. This interruption causes a change in the receiver's output signal, which is used to detect the presence, absence, or position of objects in applications requiring non-contact sensing. Characterized by their reliability, fast response times, and immunity to environmental factors like dust or moisture (as the optical path is enclosed), these switches are widely employed in industrial automation, robotics, security systems, printing equipment, and consumer electronics for tasks such as positional encoding, object counting, and limit switching.

The global Slotted Optical Switch market size was estimated at USD 65.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.25% during the forecast period.
