Report Overview:

Selective laser sintering (SLS) is a SLS method which uses infrared laser as energy source. During processing, the powder is first preheated to a temperature slightly below its melting point, and then the powder is smoothed out under the action of a scraping stick. Under the control of the computer, the laser beam is selected to sintering according to the section information of the layers. After the completion of one layer, the next layer of sintering is carried out. After all the sintering is finished, the redundant powder is removed, and a sintered part can be obtained. Selective laser sintering (SLS) is an additive manufacturing technology that converts powdered plastic materials into solid structures using a 3d-based model using a laser. It uses high-energy laser beams to transform particles into complex structures. Two important and common powder beds are selective laser sintering and direct metal laser sintering. SLS devices can seek prototypes and final products at the time of printing without seeking support.
