Abstracts

An SMA (Shape Memory Alloy) linear actuator is a type of actuator that uses the unique properties of shape memory alloys to produce linear motion. These alloys, typically composed of nickel and titanium, change shape when heated, allowing them to expand or contract in response to electrical input. When an electric current passes through the SMA wire or element, it heats up and undergoes a phase change, causing it to contract and generate linear force. SMA linear actuators are compact, lightweight, and noiseless, making them ideal for applications in robotics, medical devices, aerospace, and automotive systems, where precise, efficient, and quiet actuation is required. Their ability to convert electrical energy into mechanical motion with minimal external moving parts offers advantages in terms of reliability and design flexibility.

The global SMA Linear Actuator market size was estimated at USD 67.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 13.20% during the forecast period.
