Abstracts

Small animal ultrasound imaging system refers to an ultrasound imaging system used for small experimental animals such as mice. The main principle of small animal ultrasound imaging is to use a probe to convert electrical energy into ultrasonic waves, and transmit the ultrasonic waves into the body of the small animals through the medium, that is, the coupling agent applied to the surface of the small animal's skin. The ultrasonic waves occur when they encounter the interface of two media with different densities. Interface reflection, the reflected ultrasonic wave becomes an echo, which is still received by the ultrasonic probe, and then undergoes digital-to-analog conversion to form the final ultrasonic image. At present, typical products of small animal ultrasound imaging systems include FUJIFILM VisualSonics Vevo series, Esaote MyLab series, etc.

The global Small Animal Ultrasound Imaging System market size was estimated at USD 185.25 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.15% during the forecast period.
