Report Overview:

Small cells are low-powered cellular radio access nodes that operate in licensed and unlicensed spectrum that have a range of 10 meters to a few kilometers. They are "small" compared to a mobile macrocell, partly because they have a shorter range and partly because they typically handle fewer concurrent calls or sessions. They make best use of available spectrum by re-using the same frequencies many times within a geographical area. Fewer new macrocell sites are being built, with larger numbers of small cells recognised as an important method of increasing cellular network capacity, quality and resilience with a growing focus using LTE Advanced.

The Global Small Cell Networks Market Size was estimated at USD 3971.29 million in 2023 and is projected to reach USD 8268.03 million by 2029, exhibiting a CAGR of 13.00% during the forecast period.
