Report Overview

An electrodialysis device is a system that utilizes electrodialysis technology for the selective separation of ions from a solution. It consists of several components, including ion exchange membranes, electrodes, and a power supply. The basic principle of an electrodialysis device involves the application of an electric field across the ion exchange membranes. The membranes are selectively permeable to specific ions, allowing them to pass through while blocking others. By controlling the electric field and the arrangement of the membranes, the device can separate and concentrate ions based on their charge and size.
