Abstracts

Small molecule antibodies, also known as antibody mimetics or small molecule biologics, refer to synthetic or engineered compounds designed to mimic the antigen-binding function of traditional antibodies but with significantly smaller molecular weights, typically under 1 kDa, which enables improved tissue penetration, oral bioavailability, and manufacturing scalability compared to conventional monoclonal antibodies. These molecules?including aptamers, affibodies, nanobodies, and bicyclic peptides?are engineered to target specific proteins or receptors with high affinity and selectivity, leveraging advantages such as enhanced stability, reduced immunogenicity, and the potential for cost-effective chemical synthesis, positioning them as innovative therapeutic and diagnostic tools in areas where traditional antibodies face limitations.

The global Small Molecule Antibodies market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
