Abstracts

A small molecule inhibitor is a low molecular weight compound, typically less than 1,000 Daltons, that can modulate or block the activity of a specific biological target, such as an enzyme, receptor, or protein–protein interaction. Due to their small size and chemical properties, these inhibitors can easily penetrate cell membranes, allowing them to act on intracellular as well as extracellular targets. Small molecule inhibitors are widely used in drug development to regulate signaling pathways, inhibit pathogenic mechanisms, and treat various diseases, including cancer, infectious diseases, and inflammatory disorders. Their design often leverages structure-based drug discovery and high-throughput screening technologies to achieve high specificity and potency.

The global Small Molecule Inhibitor market size was estimated at USD 97151.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.00% during the forecast period.
