## Abstracts

Small package filling machine is a kind of equipment specially used for quantitative packaging of small doses of liquid. Small package filling machine is mainly used to fill liquid materials in small packages according to a certain proportion or capacity. It is widely used in hospital pharmacy, pharmaceutical factory, beverage factory, daily chemical factory and scientific research experiments, etc., and is suitable for quantitative packaging of various liquids such as pharmaceutical liquid, refreshing beverage, cosmetics, etc. The working principle of small package filling machine is mainly based on the principle of pressure difference, and automatic filling is realized through mechanical transmission system. Its product structure usually includes feed port, feed pipe, pump body, pump membrane, discharge port, regulating valve and filling head. During the filling process, the up and down movement of the pump membrane causes a pressure difference in the pump, so that the liquid material flows from the feed port into the pump body through the pipe, and then the liquid is precisely controlled by the regulating valve to fill the container according to the set proportion or capacity.

The global Small Package Filling Machine market size was estimated at USD 295.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.10% during the forecast period.
