The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Small Power Air-cooled Stack competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global production of Small Power Air-cooled Stacks (SPSs) reached 380,900 units, with an average selling price of US\$404.99 per unit and a gross profit margin of 30.78%. Companies will produce 5,000 to 30,000 units annually. Upstream raw materials primarily include membrane electrode materials, bipolar plates, catalysts, and BOPs. Membrane electrode materials account for 61.8% of the cost, while bipolar plates contribute 27.5%. With the gradual advancement of domestic production, raw material prices have been declining. Downstream companies include manufacturers of hydrogen-powered two- and three-wheelers, automated guided vehicles (AGVs), golf carts, and drones. A Small Power Air-cooled Stack (SPS) is a fuel cell system that uses natural convection or forced ventilation for heat dissipation. Its core generates electricity directly through the electrochemical reaction of hydrogen and oxygen, making it suitable for applications with low power requirements, lightweight design, and fast startup. In this report, the term "SPS" refers to hydrogen fuel cell stacks with a power output below 10 kW, used in low-speed hydrogen vehicles such as hydrogen-powered two- and three-wheelers and low-speed vehicles used in scenic areas.

The global Small Power Air-cooled Stack market size was estimated at USD 154.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 22.60% during the forecast period.
