Report Overview:

A star tracker is an optical device that measures the positions of stars using photocells or a camera. As the positions of many stars have been measured by astronomers to a high degree of accuracy, a star tracker on a satellite or spacecraft may be used to determine the orientation (or attitude) of the spacecraft with respect to the stars. In order to do this, the star tracker must obtain an image of the stars, measure their apparent position in the reference frame of the spacecraft, and identify the stars so their position can be compared with their known absolute position from a star catalog. A star tracker may include a processor to identify stars by comparing the pattern of observed stars with the known pattern of stars in the sky. A small satellite, miniaturized satellite, or smallsat is a satellite of low mass and size, usually under 1,200 kg (2,600 lb). Small satellite star tracker is a kind of star tracker specially designed to track small satellites.

The Global Small Satellite Star Tracker Market Size was estimated at USD 722.49 million in 2023 and is projected to reach USD 1301.03 million by 2029, exhibiting a CAGR of 10.30% during the forecast period.
