Report Overview:

A smart advisor, also called a smart advisor program, is an application program that is used to understand the natural language and complete all the electronic tasks for an end user. Such a task, which can be performed by a smart advisor and were performed by personal assistants in past, includes taking dictations, reading texts or emailing messages aloud, look up for phone numbers, anticipate requests, place calls and remind the end users about the appointments. Today's smart advisors are programmed with the artificial intelligence, voice recognition and machine learning technology. As the end users interact with their smart advisors, the Artificial Intelligence program uses the sophisticated algorithm for learning from data inputs and becomes better in the prediction of an end user's need. Tomorrow's smart advisors would be built on a modern cognitive computing technology which allows a smart advisor understanding and carrying out multi-step request and then performs more complex task like making a plane reservation. Smart advisors are a contrast to other type of consumer facing Artificial Intelligence programming called digital assistants. Smart advisors are subject oriented, on the other hand digital assistants are task oriented. For Example a Smart Advisor enables an organization to automatically identify physician with the highest or lowest cost and performance. By use of an intelligent IT (Information Technology) platform, a Smart Advisor filters the entire population of physicians in the database to extract out only those physicians which are warranting assessment based on statistical significance level, case load volume, and other key criterias.

The Global Smart Advisors Market Size was estimated at USD 1508.76 million in 2023 and is projected to reach USD 4735.12 million by 2029, exhibiting a CAGR of 21.00% during the forecast period.
