Abstracts

A smart card chip is a micro-integrated circuit (IC) embedded in a plastic card, which usually contains a processor, a storage unit and a security module, and can perform key functions such as data encryption, identity authentication and information storage. This type of chip communicates with the card reader through contact (such as bank cards) or contactless (such as NFC access control cards), and has built-in hardware-level protection mechanisms (such as side channel attack protection and secure isolation zones) to prevent data tampering or theft. It is widely used in high-security scenarios such as financial payments, SIM cards, electronic ID cards and IoT devices. The global smart card chip market has maintained steady growth in recent years, mainly driven by the demand for financial payment (EMV chip cards), IoT device authentication and government digital ID projects. With the popularization of 5G and blockchain technology and the tightening of global data security regulations (such as GDPR and CCPA), embedded chips with high security levels (EAL5+ certification) have become mainstream, and smart card chips with dual interfaces (contact + contactless) and biometrics (fingerprint/face) have grown significantly. In terms of the competitive landscape, leading companies such as NXP, Infineon, and Unigroup Guoxin account for more than 70% of the market share, but small and medium-sized manufacturers are accelerating their layout in emerging scenarios such as the Internet of Vehicles and healthcare. Future challenges include cost compression pressure, the risk of eSIM technology substitution, and the impact of the rise of localized supply chains in the Asia-Pacific region (China and India) on the price system.

The global Smart Card Chips market size was estimated at USD 5221.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.10% during the forecast period.
