## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Smart Electronic Student ID competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. The smart electronic student ID is a new generation of student identification and security management tool that integrates the Internet of Things (IoT), wireless communication technologies (such as RFID, NFC, or GPS/BeiDou positioning), and a cloud computing platform. It not only possesses the traditional student ID authentication function but also, through built-in chips and sensors, enables student attendance tracking, campus access control, and payment processing. It automatically uploads students' real-time location information (usually limited to within the school or specific secure areas) and their entry and exit status to the cloud system. Its core value lies in enhancing the intelligence level of campus management and providing schools and parents with security alerts and student tracking services to ensure student safety both on and off campus. In 2024, sales reached 4.58 million units, with an average price of \$15, a single-line production capacity of 300,000 units, and a gross profit margin of 42%. The smart electronic student ID market boasts strong and sustained growth potential, primarily driven by the rigid societal demand for campus security and real-time student monitoring. As parents and schools place increasing emphasis on student safety both on and off campus, smart student IDs, offering accurate attendance tracking, real-time location tracking, abnormal behavior alerts, and access control, have become the preferred configuration for educational institutions. Furthermore, it serves as a key entry point for the construction of global "smart campus" infrastructure. Educational departments and schools typically adopt a bulk purchasing model, using smart student IDs as the core carrier for integrating teaching, security, and logistical management systems, ensuring a stable B2G/B2B market share in the EdTech sector. Competition in

this market is no longer solely about the hardware of the cards, but rather about cloud platforms and ecosystem integration capabilities. Market observers believe that the value of solutions is shifting towards Software as a Service (SaaS). Successful companies need to provide an open, scalable platform that seamlessly integrates with existing school systems such as academic affairs, library systems, and cafeteria payment systems. The future growth point lies in using real-time data collected from student IDs (such as activity trajectory and daily routine) to analyze student behavior and provide personalized interventions, thereby offering customized safety warnings, psychological counseling, and teaching assistance, and upgrading from a simple safety tool to a comprehensive education management platform.

The global Smart Electronic Student ID market size was estimated at USD 69.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.00% during the forecast period.
