Report Overview

Power is generated at a power plant, and the TandD equipment infrastructure is used to transport the generated power to substations and then to electric utility transformers, which deliver electricity to domestic, commercial, and industrial end-users. Components such as power substations, transmission lines, power cables, switchgears, and power transformers are extensively used in power grids and electricity distribution systems. Therefore, they make primary building blocks in a TandD infrastructure. The market is segmented into power cables, transformers, and switchgears.

The increasing demand for power generation is one of the major factors that have a positive impact on the growth of the market during the next few years. With the increasing population and the rise in rapid urbanization and industrialization, the demand for power will considerably increase in the coming years. This will drive the need for new manufacturing plants and the expansion of existing plants to meet the growing demand, which will subsequently drive the need for TandD equipment.
