## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Smart Marine Emissions Monitor competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, the global market sales volume of Smart Marine Emissions Monitors was approximately 3,200 units, with an average unit price of approximately US\$67,420 and an industry gross profit margin of approximately 22%-30%. Smart Marine Emissions Monitors are online emission monitoring systems used for real-time sampling, drying, dilution, spectral analysis, and data transmission of exhaust gases from ship main engines and boilers. They continuously monitor indicators such as SO<sub>2</sub>, NO<sub>x</sub>, CO<sub>2</sub>, particulate matter (PM), and opacity to meet the reporting requirements of IMO MARPOL Annex VI, EU MRV, FuelEU Maritime, and EU ETS emissions trading. A typical system consists of an extractive or in-situ gas analysis module, a condenser dryer, an ultraviolet/infrared absorption cell, a laser scatterometer, and a data logging and ship-to-shore transmission unit, raw material costs account for approximately 58%-66% of the total system cost. The measurement range is SO<sub>2</sub> 0-3000 ppm, NO<sub>x</sub> 0-2500 ppm, and CO<sub>2</sub> 0-25% vol, with an accuracy of ±1%FS. It supports real-time uploads via the ship-to-shore EUMRV API. A typical 18,000 TEU container ship requires 1-2 CEMS systems per vessel. VLCCs and LNG dual-fuel ships typically use composite measurement units to cover both main engine and boiler power sources. Cruise ships, due to their high load and environmental concerns among passengers, may require 2-4 systems.

The global Smart Marine Emissions Monitor market size was estimated at USD 216.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 10.40% during the forecast period.
