Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Smectite Clays competitive dynamics, regional economic interdependencies, and supply chain reconfigurations.

Smectite Clays: The name bentonite was first suggested in 1898 for clay hosted by the Benton Shale in Wyoming. It was initially described as clay formed by the alteration of volcanic ash, but the most widely used commercial definition is that bentonite is clay consisting essentially of smectite minerals (usually montmorillonite) regardless of occurrence or origin. Most economic bentonite deposits are of Cretaceous age or younger and associated with marine shale and marl (Wyoming), calcareous sands and marls (Morocco), carbonaceous shales and coal (South Africa), sandstone and conglomerate (Australia), dacitic pyroclastics and tuffs (Milos), andesite (China) or rhyolite and obsidian/perlite (China and Mozambique). Bentonite is characterised by exchangeable cations such as Ca^{2+} , Mg^{2+} , Na^{+} or Li^{+} which affect its designation and properties. For example, bentonite is typically described as either swelling or nonswelling bentonite. Swelling bentonite (also known as western bentonite) is sodium bentonite that swells in water and is generally used in its natural state. Non-swelling bentonite is calcium bentonite (also known as southern bentonite) that is used as mined, after treatment with soda ash to produce sodium-exchanged bentonite, or treated with acid to produce bleaching clay. Li-rich bentonite is known as hectorite and is commercially mined only in the US. Natural bentonites occur in two main forms: Na-based and Ca-based. While Ca-bentonite is more common, Na-bentonite is a more effective binder. To boost the binding power of Ca-bentonite, it is subjected to a chemical reaction with soda ash to activate its outer and inner surfaces, which increases its ability to bind water. In 2024, global Smectite Clays production reached approximately 19.5 million tons, with an average global market price of around US\$ 78.3 per ton. The average gross profit

margin in this industry is 20%-30%. Global 5 largest manufacturers of Smectite Clays are Minerals Technologies (Amcol), Bentonite Performance Minerals LLC (BPM), Clariant, Imerys (S&B) and Black Hills Bentonite LLC, which make up about 54%. Among them, Minerals Technologies (Amcol) is the leader with about 18% market share. North America is the largest market, with a share about 32%, followed by Europe and Asia-Pacific, with share about 31% and 29%. In terms of product type, Sodium Bentonite occupy the largest share of the total market, about 88%. And in terms of product application, the largest application is Molding Sands, followed by Drilling Mud.

The global Smectite Clays market size was estimated at USD 1526.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
