Abstracts

Smoke evacuation dampers are specialized fire protection devices installed within heating, ventilation, and air conditioning (HVAC) ductwork systems that are designed to automatically open in the event of a fire to allow smoke and hot gases to be exhausted from the building, thereby improving visibility for evacuation, reducing smoke inhalation risks, and aiding firefighting operations by controlling the spread of smoke; these dampers are typically constructed from galvanized or stainless steel for durability and heat resistance, incorporate fusible links or actuators that trigger at specific temperatures, and are engineered to maintain their structural integrity under high temperatures while preventing the recirculation of smoke through the HVAC system.
