Abstracts

Soda ash, or sodium carbonate (Na_2CO_3), is an inorganic compound produced primarily through two main industrial processes: the Solvay process and the mining of natural trona ore. The Solvay process involves a series of chemical reactions starting from salt brine and limestone, yielding soda ash, calcium chloride, and carbon dioxide as byproducts, while trona mining extracts the mineral directly from underground deposits, which is then refined into soda ash through calcination and purification. Both methods aim to produce high-purity soda ash, a critical raw material used extensively in glass manufacturing, detergents, chemicals, water treatment, and various other industrial applications, with the choice of production method often influenced by geographic availability of raw materials, energy costs, and environmental regulations.

The global Soda Ash Production Process market size was estimated at USD 28500.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 3.50% during the forecast period.
