Abstracts

Sodium polyacrylate starch is a superabsorbent polymer derived from the reaction between starch and polyacrylic acid, combining the natural biodegradability of starch with the high water-absorption capacity of synthetic polyacrylate. It is widely used in applications such as agriculture for water retention in soil, personal care products like diapers and sanitary napkins for moisture control, and industrial sectors for spill containment and wastewater treatment. The material is valued for its ability to absorb and retain large volumes of water or aqueous solutions, forming a gel-like substance that locks in moisture, making it particularly useful in water-scarce environments and in products requiring prolonged hydration management.

The global Sodium Polyacrylate Starch market size was estimated at USD 420.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
