Abstracts

A soft bearing dynamic balancer is a device used to measure and correct unbalance problems in rotating machinery such as motors, fans, pumps, etc. Unlike hard-bearing dynamic balancing machines, soft-bearing dynamic balancing machines use a flexible support system to support rotating machinery to reduce interference with measurement results. The working principle of the soft bearing dynamic balancing machine is to install the rotating machinery on a flexible support system so that the machinery can freely vibrate in the horizontal and vertical directions during the balancing process. Then use the sensor to measure the vibration signal, and analyze and calculate it through the data processing unit to determine the position and size of the imbalance. Finally, corrective actions are performed based on the calculations, usually by adding or removing correcting masses to the rotating machinery to achieve balance. Soft bearing dynamic balancing machines have some advantages over hard bearing dynamic balancing machines, such as being able to handle a wider range of rotational speeds and higher sensitivity, with less impact on measurement results, etc. They are usually widely used in industries requiring high precision, such as aerospace, automobile manufacturing, power industry, etc.

The global Soft Bearing Dynamic Balancing Machine market size was estimated at USD 185.5 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
