Abstracts

Soft carbon anode materials are a class of carbon-based materials with a partially graphitized structure, characterized by their turbostratic or disordered carbon layers that offer intermediate crystallinity between hard carbon and graphite. These materials exhibit favorable properties such as moderate specific capacity, excellent rate capability, and cycling stability, making them suitable for use in lithium-ion batteries, particularly for applications requiring high-power performance like electric vehicles and energy storage systems. Unlike graphite, soft carbon can be graphitized at high temperatures to achieve higher electrical conductivity, while its disordered structure allows for better lithium-ion diffusion kinetics and resilience to volume expansion during charge-discharge cycles.

The global Soft Carbon Anode Materials market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
