Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Soft Carbon Material for Sodium Ions competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Soft carbon materials for sodium-ion batteries are amorphous or low-graphitization carbon materials primarily derived from petroleum coke, asphalt, or sugars through thermal treatment. Compared to hard carbon, soft carbon has a structure that is more easily penetrated and released by sodium ions, resulting in lower initial irreversible capacity loss and better conductivity. However, its sodium storage capacity and cycle stability are slightly lower. Currently, soft carbon materials, due to their mature production processes, lower costs, and good compatibility, hold application potential in low-cost sodium batteries and medium-to-low-rate energy storage scenarios. They are often used as the primary anode material or blended with hard carbon to balance performance and cost.

The global Soft Carbon Material for Sodium Ions market size was estimated at USD 597.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 2.40% during the forecast period.
