Abstracts

The Soft Magnetic Material Coercivity Measuring Device is an instrument used to test the ability of soft magnetic materials to recover their magnetic properties after an external magnetic field is removed. Coercivity is an important parameter to evaluate the hysteresis characteristics of soft magnetic materials and is typically used to assess the material's magnetic performance, especially in applications such as transformers, motors, and inductors. The device applies an external magnetic field and measures the residual magnetic flux density of the material after the external magnetic field is removed, thus calculating the coercivity. Common measurement methods include oscillating field and direct current field methods. The equipment typically features high-precision magnetic field control and measurement capabilities to ensure the accuracy and reliability of the results.

The global Soft Magnetic Material Coercivity Measuring Device market size was estimated at USD 118.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
