Abstracts

Soil enrichment is the process of enhancing soil quality to optimize it for crop cultivation. This crucial aspect of agriculture involves preparing and amending the soil well in advance of planting, typically about a month prior, to ensure that it meets the specific needs of the crops to be grown. Common soil enrichment materials include organic compost like cattle manure, which enhance both water retention and drainage while also contributing to soil fertility. Soil enrichment aims to create a soil environment that is ideal for crop growth. Ideal soil characteristics include moisture retention, effective drainage, high fertility, balanced nutrient content, a healthy microbial ecosystem, and a soft, crumbly texture. Using the right soil enrichment materials can help achieve these characteristics, thereby improving plant growth and resilience against pests and diseases.

The global Soil Enrichment Services market size was estimated at USD 4980.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.30% during the forecast period.
