Report Overview:

A Soil moisture monitoring comprises testing the soil for its water content or for its ability to have water extracted through being squeezed by plant roots (known as soil suction or soil moisture tension) in order to better assess how much or little water is required, in order to avoid wastage.

Moisture monitoring is used to assess whether too much water has been applied to the soil, which can lead to water soaking well below the reach of plant roots, effectively wasting the water used and increasing pumping costs as well as leaching nutrients. Similarly, moisture monitoring can also establish if too little water is being used to irrigate a crop. This can lead to reduced crop yields due to plant stress, salt accumulation in the soil's 'rootzone' (the level at which plants actually compress the soil to extract moisture) and a deterioration in the nutrient quality of the soil.

The Global Soil Moisture Monitoring System Market Size was estimated at USD 123.46 million in 2023 and is projected to reach USD 209.34 million by 2029, exhibiting a CAGR of 9.20% during the forecast period.
