### Report Overview:

Soil moisture sensors measure the volumetric water content in soil. Since the direct gravimetric measurement of free soil moisture requires removing, drying, and weighting of a sample, soil moisture sensors measure the volumetric water content indirectly by using some other property of the soil, such as electrical resistance, dielectric constant, or interaction with neutrons, as a proxy for the moisture content. The relation between the measured property and soil moisture must be calibrated and may vary depending on environmental factors such as soil type, temperature, or electric conductivity.

The Global Soil Moisture Sensor Market Size was estimated at USD 118.72 million in 2023 and is projected to reach USD 172.26 million by 2029, exhibiting a CAGR of 6.40% during the forecast period.
