Report Overview

Soil Nitrogen Cycle Monitoring System using gas chromatograph for analysis is called gas chromatography. The working principle is: after the sample solution is injected, it first enters the vaporization chamber, and then enters the chromatographic column under the transmission of the carrier gas (the carrier gas is usually nitrogen or helium), and the different components are separated in the chromatographic column, and finally flow out of the chromatographic column in sequence. The column is detected by the detector to obtain its content.

The global Soil Nitrogen Cycle Monitoring System market size was estimated at USD 185.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
