Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Solar Cell Silver Paste competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Solar cell silver paste is a conductive material used to form electrical contacts on both the front and back sides of photovoltaic cells, particularly in crystalline silicon solar cells. It consists of silver particles mixed with glass frit and organic binders. The front silver paste is typically screen-printed into fine gridlines (fingers and busbars) to collect and transport the electric current generated by sunlight. In some cell architectures, especially in high-efficiency designs like PERC or IBC cells, silver paste is also applied to the rear side to form rear contacts. During the firing process, the paste solidifies into a low-resistance metallization layer, enabling efficient current flow. Silver paste is critical for performance, and ongoing research aims to reduce silver usage while maintaining conductivity and contact quality. At present, the global solar cell silver paste market is undergoing a transformation period dominated by technological iteration. The commercialization of N-type battery technology (such as TOPCon and HJT) has accelerated the significant growth in the demand for front silver paste, and its high conductivity, thin line and low-temperature process adaptability have become the core driving factors for technological upgrading; while the back silver paste has a relatively solid functional positioning, the pace of technological upgrading is relatively slow, and the market growth depends more on the scale expansion of battery production capacity. This trend has prompted the upstream and downstream of the industrial chain to accelerate collaborative innovation to balance the goals of efficiency improvement and cost optimization. The industry competition landscape presents the characteristics of head concentration and technological innovation in parallel. Head companies consolidate their market position through high-end product research and

development (such as HJT low-temperature silver paste), and strengthen cost control capabilities through vertical integration (such as self-supply of silver powder); while small and medium-sized enterprises face the dual challenges of technical barriers and profitability. Market resources are further tilted towards manufacturers with technological leadership and supply chain stability, driving the industry to evolve towards high efficiency and low carbon.

The global Solar Cell Silver Paste market size was estimated at USD 3150.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.80% during the forecast period.
