## Abstracts

Solar module recycling service refers to the systematic process of handling end-of-life solar panels to recover valuable materials and minimize environmental impact. As the solar energy industry expands rapidly, a growing number of solar modules reach the end of their operational lifespan. Recycling services involve disassembling these modules using specialized techniques to separate components such as silicon, glass, metals (including silver, aluminum, and copper), and sometimes other materials depending on the module type. The recovered materials can then be reintroduced into the manufacturing cycle, reducing the need for virgin resources and conserving energy. This not only offers economic benefits by providing cost-effective raw materials but also addresses environmental concerns, preventing potential pollution from hazardous substances in the modules and ensuring sustainable development of the solar energy sector. The global solar module recycling service market is in a stage of rapid development, driven by factors such as the increasing number of decommissioned solar panels, the emphasis on the circular economy, and strict environmental regulations. The global installation of solar panels has been increasing significantly. Emerging markets such as Africa, Southeast Asia, and Latin America are rapidly adopting solar energy, which has opened up new opportunities for the development of solar panel recycling infrastructure and facilities. However, currently, developed regions such as Europe may have more mature recycling systems due to earlier-implemented regulations and higher environmental awareness.

The global Solar Module Recycling Service market size was estimated at USD 445.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 11.30% during the forecast period.
