## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Solar Mosquito Trap competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, the global production of solar mosquito traps reached 13.25 million units, with an average price of US\$21.7 per unit. Solar mosquito traps are devices that use solar energy as energy to attract and capture mosquitoes through specific technical means. Mosquitoes are phototropic, and the traps are usually equipped with LED lights of specific wavelengths, which emit light that can attract mosquitoes. The wavelength of these lights is generally around 365-400 nanometers, close to ultraviolet rays, and has a strong attraction to mosquitoes. The solar-powered mosquito trap industry chain consists of upstream suppliers of photovoltaic modules, electronic components, plastic structural parts, and LED ultraviolet lamps. Representative upstream companies include Jinko Solar, LONGi Green Energy, MLS, Oppl Lighting, Desay Battery, and Kumho Solar. Downstream demand primarily targets outdoor gardening product brands, residential and villa communities, farms, forestry and fisheries, resort hotels, parks, and urban public spaces. Typical customers include Home Depot, Trujia, Walmart, Costco, Koto Outdoor, and BiteFighter. Downstream demand growth is concentrated in the refined management of outdoor mosquito control scenarios and residential upgrades. Farms and landscaping departments are also driving the replacement of professional trapping equipment. Driven by increased clean energy penetration, growing outdoor leisure consumption, and strengthened urban and rural public health governance, the industry is developing towards high-efficiency trapping, intelligent detection, long battery life, and maintenance-free operation. Technological advancements mainly focus on improving low-light power generation capabilities with high-efficiency solar panels, precise matching of LED mosquito-attracting wavelengths, optimized wind suction structures,

automatic trap cleaning functions, and IoT remote monitoring. The obstacles include the performance of solar panels affected by unstable sunlight, fierce price competition due to widespread imitation of low-end products, tightening regulations on light pollution from trap lights in some regions, and increased costs due to improved weather resistance of outdoor equipment. A mature assembly line has an annual production capacity of approximately 200,000 to 350,000 units, with a gross profit margin generally maintained between 18% and 30%.

The global Solar Mosquito Trap market size was estimated at USD 288.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.30% during the forecast period.
