## Abstracts

To address the challenges of high energy costs in industrial and commercial sectors, high investment barriers for renewable energy, and unstable clean electricity supply, solar power purchase agreements (PPAs) have emerged. Since their gradual popularization in the early 21st century with the maturation of photovoltaic technology and innovation in the financial market, this agreement model has evolved from a basic long-term power purchase contract into a standardized financial instrument encompassing various structures such as physical, virtual, and aggregated contracts. Currently, solar power purchase agreements are widely used in large enterprises for clean energy use, low-carbon transformation of data centers, green power supply for municipal facilities, and distributed energy projects in industrial parks. Through models such as "self-consumption with surplus power fed into the grid" or "full grid connection," they provide users with long-term, stable, and lower-than-grid-price green electricity, effectively reducing electricity costs, achieving carbon emission reduction targets, and promoting energy structure transformation. As a core tool for green electricity trading, solar power PPAs are developing towards higher precision, intelligence, and globalization. With technological breakthroughs and policy support, they will play a crucial role in the global energy transition, helping to achieve the Paris Agreement's 1.5°C temperature control target, promoting the transition from "policy subsidies" to "market-driven" approaches, and becoming a green bridge connecting energy producers and consumers.

The global Solar Power Purchase Agreement (PPA) market size was estimated at USD 842.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.70% during the forecast period.
