### Report Overview:

Solar LED street lights are systems that get their power from the sun and make electricity and light. The way solar LEDs work is that sunlight is turned into electricity, which lights the lamp directly and heats water for use in the home at night. In a solar street lighting system, photovoltaic panels are put on the top of the lamp post to store energy from the sun. When fossil fuels are used, the chance of climate change goes up. This means that we need to switch to green energy. Solar street lights cut down on how much we rely on traditional energy sources, help cut down on carbon emissions, and help us reach our green energy goals. Solar street lights are a good way to light up places that don't have enough electricity. Solar street lights are used on many streets, roads, courtyards, parks, airports, and other places.

The Global Solar Powered LED Street Light Market Size was estimated at USD 1515.19 million in 2023 and is projected to reach USD 2834.04 million by 2029, exhibiting a CAGR of 11.00% during the forecast period.
